Abstract

Background

The proliferation of fast-food outlets (FFOs) in residential areas has raised growing concerns about their impact on community health, safety, and wellbeing. This qualitative study examined both pre-development community consultation submissions and post-development resident experiences surrounding the development of a McDonald's outlet in a newly established suburb on the urban fringe of Perth, Western Australia (WA).

Methods

Using a qualitative descriptive design, the study analyzed 183 community submissions lodged with the local council prior to development and conducted semi-structured interviews with 11 residents living within 300 meters of the outlet after construction.

Results

Content analysis revealed strong opposition, with 168 (92%) submissions objecting to the development. Key concerns included health, FFO density,

proximity to schools, traffic congestion, safety, pollution (noise, litter, light, odor), antisocial behavior, neighborhood amenity and property devaluation. Despite these concerns, all objections were dismissed by the council on planning grounds. Post-development interviews revealed that residents' lived experiences reflected all of the very issues they had predicted, expressing frustration with poor council transparency and perceived apathy.

Conclusion

The findings reveal a clear disconnect between what communities want and what planning systems deliver, highlighting the need for planning reform in WA that prioritizes public health through exclusion zones, density restrictions and mandatory health impact assessments. As WA councils prepare to implement mandated public health plans under the Public Health Act 2016, these findings provide timely evidence to strengthen community engagement and support health-promoting urban planning.

Key Words

Fast-food outlet, Food environment, Public health, Policy, Planning, Obesity

Background

Our modern food environment has become increasingly saturated with fast food outlets (FFO) (1), particularly in disadvantaged areas surrounding schools (2, 3). This is of considerable concern given the positive association between FFO around schools and increased purchasing of discretionary foods (4, 5) and increased prevalence of obesity (6). The continued proliferation of these outlets therefore represents a major challenge for communities seeking to promote healthier environments for children.

Despite strong community opposition to new FFO developments (7) and repeated calls for local, state and national governments to prioritize healthy, livable and sustainable cities (8-10), expansion continues at pace. In 2023 alone, 227 new Fast Food and Quick Service Restaurant chains opened in Australia, including 25 new McDonald's outlets (11). McDonald's has explicitly stated its goal of ensuring most Australians live within a five minute drive of one of its stores (1). This corporate expansion strategy highlights the tension between commercial interests and public health goals, a tension that plays out most visibly within local planning systems and demonstrates how the commercial determinants of health leverage influence within systems, practices and pathways of our residential suburbs.(12)

Local Government Authorities (an equivalent internationally would be called a district, county, borough or municipality and is herein referred to as the local council or council) are central to these planning and development

processes. Councils manage statutory consultations, interpret planning instruments, and provide advice or determinations on development applications. However their ability to reject FFO developments is often constrained by state planning frameworks, which can limit the extent to which public health concerns are considered (13). From June 2026, all WA Local Governments will be mandated under the Public Health Act 2016 (WA) (14) to produce public health plans, formally embedding community health into their remit. Understanding how these councils balance planning legislation, public health responsibilities and community expectations is increasingly important for shaping future policy responses.

Public consultation has become a key mechanism through which councils engage communities in planning decisions (15). However, once developments are approved and constructed, opportunities to capture resident's lived experiences and reflections are rare. Much research has mapped the proliferation of FFO (16-18), yet the personal experiences of community members most affected by these developments remain absent from academic literature. Exploring these firsthand accounts can provide valuable insights into the social and environmental consequences of FFO expansion, as well as the perceived shortcomings of current planning processes.

Methods

This study aimed to explore the experiences and perceptions of residents living in close proximity to a newly developed McDonald's outlet, and to examine the community consultation submissions lodged with the local council prior to its construction. By analyzing both pre-development objections and post-development lived experiences, this study provides novel insights into how corporate expansion strategies intersect with local planning processes, and how residents perceive the health, social, and environmental impacts of FFOs in their neighborhoods.

This study employed a qualitative descriptive design incorporating two data sources: (i) a document analysis of community consultation submissions to the local council prior to the development of a McDonald's FFO; and (ii) semi-structured interviews with residents living in close proximity to the outlet following its completion. The Consolidated Criteria for Reporting Qualitative Research (COREQ) guided the reporting of this study. (19)

Setting

A McDonald's FFO was built on the urban fringe of Perth, WA, in December 2023. With a dual lane drive through, on an area of 2,581m² and co-located with a 7-Eleven service station, the McDonald's abuts a residential street, is 550m from the local high school (students 13 to 18 years), 600m from an early learning center (children aged up to five years) and 950m from the nearest primary school (students from five to twelve years).

Sampling and Recruitment

Community Consultation

The local council advertised the development application for community consultation on 23 December 2021, to conclude on 14 January 2022. The normal period of consultation is 14 days however, due to the 'holiday period' and an additional request from council, the consultation period was extended to 21 days. Advertising of the consultation was by way of notice in the local newspaper and writing to 271 nearby landowners/occupiers within approximately 350 meters of the proposed development. The development plans and all supporting documentation were also published on the council's website. Residents were invited to submit comments on the planning proposal using an online form and submissions were publicly available for download upon closure of the submission period. (20) The FFO opened on 9 December 2023.

Resident Interviews

A total of 3,495 residents living within a 3km radius of the new FFO development were purposively sampled through a postal survey of a larger study which included an invitation to participate in a follow-up interview. The purpose of the larger umbrella study was to explore the impact of the FFO development on the health of residents living near to the FFO and included questions on dietary intake, food purchasing behaviors, food and taste preferences and various perceptions of the neighborhood. A total of 171 adults provided informed consent and completed the survey, and residents living within 300m of the new FFO development that responded positively to the follow-up interview invitation formed the sample for this

present study (n=11). These 11 participants were emailed a participant information form, which outlined the process of the qualitative study interview, study approval details and informed consent process. They then completed an online consent form and were subsequently contacted via email or telephone to arrange a convenient time for interview. Interviews were held between January to May 2024 and only adults living in the household were eligible to participate. Interview participants were aware of the research teams' heightened interest in the effect of the McDonald's development on their community, but were otherwise unknown to researchers, and vice versa.

Data collection

Community Consultation

The schedule of community submissions was downloaded on 6 June 2023 from the planning Website (20) for categorizing and interpretation.

Resident Interviews

A semi-structured interview guide consisting of eight questions was developed for this study by a team of researchers with expertise in nutrition, food environments and qualitative research methods (*see Supplementary File 1*). The guide explored residents' perspectives of the new McDonald's outlet approval process, construction and subsequent impact. Participants also provided demographic and personal information, including gender, presence of school-aged children in the home, and frequency of accessing the new McDonald's. Individual interviews were

conducted by CW and JB between January and May 2024. Study participants were given the option of a video conference or telephone interview. Interviews ranged between 10 and 40 minutes and were recorded and transcribed with participants' permission. Data collection was conducted in parallel with data analysis, with recruitment ceasing once interviews stopped generating new codes.

Data Analysis

Interview transcripts were analyzed with the assistance of the qualitative research software package, QSR NVivo, Version 12. Qualitative content analysis was undertaken to capture participants' findings in their own words (21). A research team member familiarized themselves with the data by re-reading transcripts and developing initial codes. Open coding was used to assign the data to codes, which were then refined to create sub-themes and themes. Themes and sub-themes were discussed with the co-authors before a consensus was reached.

Community consultation submissions were analyzed independently of the interview data using a similar qualitative content analysis approach. Key issues from the community submissions were coded inductively to identify recurrent themes. These themes and sub-themes were then compared with the qualitative interview findings to explore areas of overlap and divergence. If a submission contained more than one issue, then each issue was coded and analyzed independently.

Results

Table 1 categorizes the content of submissions made to council in each objection to the new McDonald's. There were 168 objections out of a total of 183 submissions. Objections within each submission were categorized as: i) approval process and construction (n=29); ii) impact on community (n=443); and iii) suggested alternative to FFO (n=21).

The council administration comments (not presented) in response to the submissions outlined that the objections were unaligned or outside of valid planning considerations. For all submissions, the recommended action from council was 'no modification required'.

Table 1. Submissions to Council in objection a new fast-food outlet development: Themes and sub-themes

Theme	Sub-theme	#	Council Recommendation
Approval process and construction	Transparency of council and/or developers	29	No modification required
Impact on community	Quantity of fast-food outlets already in area	110	
	Unhealthy lifestyle for community	42	

	Proximity to residential area and schools	40	No modification required
	Traffic congestion and parking	74	
	Anti-social behavior	46	
	Dangerous traffic for children	12	
	Pollution		
	Light pollution	11	
	Litter pollution	12	
	Noise pollution	26	
	Odor pollution	22	
	Estate aesthetic	34	
	Property value	14	
Suggested alternative to FFO	Healthy café/post-office/library	21	No modification required

1). Interview Participant Characteristics

Table 2. describes the characteristics of the 11 study participants who agreed to be interviewed. All participants were residents located within 300m of the FFO.

Table 2. Participant characteristics of study sample located within 300m of the FFO

Characteristic	<i>n</i>	%
Gender		
Female	8	73%
Male	3	27%
Presence of School Aged Children in the Home		
Yes	5	45%
No	6	55%

2). Resident interviews: perspectives on the development of a fast-food outlet

Table 3 lists the themes and sub-themes identified during the analysis of residents' perspectives on the development of a FFO. Three overarching themes were identified.

Table 3. Perspectives of residents living next to a fast-food outlet: themes and sub-themes

Theme	Sub-theme
Approval process and construction	Mode of communication
	Perception of Council
Impact on community	Health
	Location
	Safety
	Pollution
	Finances
Strategies to foster healthy food environments	Education
	Urban planning and promotion

2.1. Approval Process and Construction

Residents' perspectives on the FFO approval process and construction were divided into two categories: i) mode of communication; and ii) perception of council.

Mode of Communication

Residents learnt that a FFO was being constructed in their neighborhood via three modes of communication: i) community word-of-mouth or social media; ii) local council communication; and iii) construction site signage.

Some participants noted that they had not received any formal notification from the council that construction of a FFO had been proposed or approved, instead learning about the development via word-of-mouth or social media:

We hadn't moved into the home yet because we were still under construction.... so we didn't find out until we saw it on a Facebook page. (Participant #10)

Only some residents reported receiving direct communication from the council via a leaflet in their letterbox or during a council meeting where support and objections were discussed. Participants also noted discrepancies between the information they received about commercial developments when purchasing their property and the eventual outcome:

When we signed the contract for the land, we asked what it was likely to be and were told a doctors or a physio or cafe, something like that, so when the information came through from [named] Council about the objections and submitting our grievances, we were just as surprised as everybody else in the estate. (Participant #1)

For other participants, the first indication of the FFO presence was the appearance of signage on the construction site:

We found out when we just saw the buildings, so when we saw the McDonald's sign being put up. (Participant #8)

Perceptions of Council

Participants' perceptions of how the council managed the outlet's approval process and development were predominantly negative and included: i) disappointment in council conduct; and ii) perceived council apathy.

Many residents expressed disappointment in the council's perceived disregard for residents' objections. Participants noted that some residents were unaware of the FFO and were not given an opportunity to object to the development as their homes were still under construction:

I was just disappointed in [named] council's blatant disregard for what the residents had to say. I mean, there was so few of us to contest it.

(Participant #1)

Some participants also reported perceived apathy from council representatives, who participants felt were indifferent to community objections:

I was kind of impartial, but if my say actually mattered, I would say maybe no [to the fast-food outlet], but I knew they were gonna[sic] do what they were gonna[sic] do regardless. (Participant #9)

One participant also expressed their disappointment about the changing nature of the neighborhood given the council's support of FFO:

I just really, really feel very negative about how this neighborhood is turning into a fast-food hub. (Participant #10)

2.2. Impact on Community

Residents' perspectives on the impact of the operational FFO on the local community were divided into five categories: i) health; ii) location; iii) safety; iv) pollution; and v) finances.

Health

Many participants spoke about the real and perceived health impacts of the FFO on community members. Some participants expressed concern about the long-term physical health effects of eating unhealthy food from the FFO, particularly for school children who now have greater access to unhealthy food options:

Have we not got a duty of care to look after the children? It's ultimately going to have a massive impact on the health system when we've got the obesity problem and diabetes and they're all having to attend clinics, because [fast food] is cheap. (Participant #1)

In addition to the long-term impacts on children's health and the larger health care system, one participant noted the short-term, negative health impact of eating unhealthy food:

It's really unhealthy and it makes you feel disgusting after. (Participant #7)

Participants also noted that the presence of the FFO was inconsistent with their expectations of a healthy, family-friendly neighborhood:

We moved to this area because we thought it was going to be a great area to raise a family, raise kids. It's extremely disappointing and I'm honestly really concerned that the kids in local schools are not going to be supported in trying to make healthy decisions because all they have are unhealthy options. (Participant #10)

In addition, some participants reported experiencing stress caused by safety concerns associated with the outlet, particularly regarding the outlet's 24-hour operation:

[Safety] is at the back of my mind, especially with them being able to use the second exit, being able to come out and be in the estate... And especially with it being a 24-hour [outlet] as well. It's at the back of my mind all the time because it's so quiet here and it's been great. So yeah, it is a concern. (Participant #1)

Location

Many participants were disappointed in the location of the FFO, particularly its close proximity to other outlets, residential housing and schools:

McDonald's, two Hungry Jacks, flipping Taco Bell. I don't mind the sushi shops and things like that. But how many McDonald's do you need within one or two kilometers. It's daft. (Participant #5)

Similarly, some participants expressed frustration that the outlet was being built in a residential neighborhood:

I understand a McDonald's being in a commercial development but not in the middle of a housing estate. (Participant #1)

Participants also complained that they could see the outlet from their home:

I can see McDonald's through my window. (Participant #7)

Participants were also concerned about the close proximity of the outlet to the local high school and subsequent appeal to children:

I do think they are a little bit close to the high school because you used to see all the children head off and go home, but now you see all the children crossing [named dual highway] and then going over to the fast-food outlets and hanging around there. (Participant #2)

Safety

Participants' perspectives on the impact of the FFO on community safety focused on the potentially negative impact of the FFO on: i) anti-social behavior; and ii) traffic safety and pollution.

Some participants attributed incidents of theft and the subsequent need for security measures around their home to the presence of the FFO:

I'm literally about to invest in cameras...because expensive [items] like my boots and stuff for work [have] been stolen... and there's some weird people that hang around on the streets. (Participant #7)

In addition to crime-related concerns, some participants noted the dangers posed to school children due to increased road traffic around the FFO:

Traffic can be very bad on this roundabout, and I've noticed when the kids are trying to cross the road to school... there's no crossing there. They're basically just running and it's very dangerous. It is not a good situation. (Participant #4)

While the increased traffic affected all children on their school journey, it was particularly dangerous for children trying to visit the FFO:

There's a school not very far away, which means the children have to cross a really busy main road to get to McDonald's and I just see it's potential for an accident, unfortunately. (Participant #3)

Pollution

Pollution was identified as another potential impact of the FFO on the local community, with participants identifying pollution from: i) light; ii) litter; iii) noise; and iv) odor.

Some participants reported experiencing light pollution as a result of the FFO, noting that light could infiltrate their homes. However, other

participants noted that they were generally unaffected by light pollution as they rarely left their home after dark:

I don't go out at night, so I don't actually see [light pollution], so that doesn't bother me. (Participant #3)

Many residents observed increased litter within the neighborhood as a result of the FFO:

There's a park right across from the McDonald's, and there's a Council bin and the bin was overflowing one day last week with rubbish from McDonald's... (Participant #1)

Noise pollution was also discussed by participants, with some noting that residents who lived closer to the FFO were most affected by both traffic and exhaust fans:

The way the drive-through is shaped, it comes right across the side of our street. So if a noisy car goes through, we hear that. It's actually from the main bedroom at the front of the house. (Participant #10)

I don't notice it in my house, but when I walked past, I did notice exhaust fans. I didn't know what it was, but it was noisy and I just felt so sorry for the people that are living very, very close to it because they must hear it all the time. (Participant #3)

Finally, odors from the FFO also affected residents, particularly those living closest to the outlet:

Absolutely, you smell [odors from the outlet] as soon as you open a window. As soon as you step outside the house. (Participant #10)

Finances

The financial impact of the FFO was also noted by participants, particularly regarding: i) the potential impact on property prices; and ii) costs associated with frequenting the outlet.

Some participants expressed concerns that the presence of the FFO would negatively affect the value of their property, particularly for those residents whose properties overlooked the outlet:

One of the ladies was quite heartbroken because she said it was her first home that she bought and she felt that it had devalued the home because she's right overlooking the McDonald's. (Participant #3)

Other participants noted the negative financial costs of regularly purchasing fast-food given the convenience and accessibility.

2.3 Strategies to foster healthy food environments within the community

Participants suggested a number of potential strategies to counteract the inclusion of the FFO and foster healthy food environments within their community. These strategies were divided into: i) education; and ii) planning.

Education

Participants identified a number of educational strategies to foster healthy food environments within their community, including: i) school-based education; ii) parent education; and iii) health promotion initiatives.

Some participants expressed their belief that integrating healthy food education into the school curriculum was a potentially effective strategy for cultivating healthy habits in children:

Even at primary school level they could get started on it - healthy food choices and steering away from fast food. (Participant #2)

Participants also spoke about actions that schools could take to encourage healthy eating outside the classroom:

I know some schools sometimes do those community food days where it's almost like food trucks or people come in with a variety of foods... community events like that coming to schools always attract students' attention. So if it was healthier options, that might be a good way to do it. (Participant #9)

In addition to school-based education, participants emphasized the importance of engaging and educating parents about healthy eating habits at home:

I think it's twofold. I think it's the parents, I think maybe education at the school as well. (Participant #1)

Participants also suggested incorporating health promotion activities into community events to raise awareness and create positive food habits:

I know the City of [named Council] are usually at little events but they're usually more focused towards recycling... If they started doing some food encouragement of healthier options around the area that would get the kids involved because they always do nice little kids' games at all the little events around the place. If they did one involving a bit of healthy food too, I guess that would get the kids a bit more interested. (Participant #15)

Urban planning

Participants emphasized the importance of effective urban planning to reduce the negative impacts of FFO on the community and foster healthy food environments. Suggested urban planning strategies included developing policies that addressed: i) FFO proximity to schools; ii) FFO density; and iii) the presence and promotion of healthy food outlets.

Some participants suggested that Councils should implement restrictions on the proximity of FFO to schools and expressed confusion about urban planning policies that currently exist:

I thought there were laws about putting fast food outlets within a certain distance from a school. (Participant #10)

Participants also suggested that Councils should limit the quantity and clustering of FFO within neighborhoods:

Local councils probably shouldn't be putting that many fast-food outlets in community areas, especially closer to schools. (Participant #8)

Finally, some participants proposed the promotion of healthy food outlets within the neighborhood:

They could promote healthier [food outlets], if there's some more healthier outlets or healthier options for the children. (Participant #1)

Discussion

This is the first known study of both community consultation submissions and residents' lived experiences following the development of a McDonald's FFO in their neighborhood. While previous research has explored how new FFOs influence eating behaviors (22), none have examined this issue from the dual perspective of pre-development objections and post-development realities. By combining these data sources, this study offers unique insights into the disconnect between local decision-making processes and community health priorities.

Despite 168 (92%) formal submissions opposing the FFO development, the Council dismissed all objections as being outside of valid planning considerations. The perceived lack of responsiveness by Council, developers and the McDonald's corporation was a central concern among residents,

who described feeling ignored and powerless. This finding mirrors national reports of similar developments in which local authorities have overridden community opposition (23, 24), reinforcing a broader pattern of community disempowerment in urban planning decisions. The contrast between residents' pre-development concerns, such as outlet density, pollution, safety and children's health, and their post-development lived experiences underscores the tangible impacts of planning decisions on daily life.

The residential area in this study was purported to be a highly rated 'green star' sustainable community, designed to promote walkability, family-friendly living and access to schools and recreational spaces. Residents viewed the introduction of a 24-hour McDonald's outlet as fundamentally misaligned with this vision, citing noise, litter, odor, traffic congestion and safety concerns as evidence of policy incoherence. Rather than contributing to community wellbeing, the FFO was perceived as diminishing the area's livability and undermining its sustainability goals. This highlights the growing gap between policy rhetoric promoting healthy, sustainable neighborhoods and planning frameworks that continue to facilitate the establishment of unhealthy food environments.

Under the WA Public Health Act 2016 (14) local governments are required to develop Public Health Plans aimed at building safe, sustainable, livable, healthy connected communities. Yet, the findings from this study reveal a striking contradiction between these legislative aims and the practical

constraints of planning systems. Councils' capacity to reject FFO developments appears limited by state planning laws (25) which prioritize commercial and zoning considerations over community health.

Consequently, even well-intentioned councils may be unable to act on residents' health concerns. This policy misalignment demonstrates how current planning systems can inadvertently perpetuate health inequities by prioritizing corporate and economic interest over local wellbeing.

Although residents proposed educational strategies, such as school-based programs and parental engagement to mitigate the influence of FFOs, education alone cannot address the broader structural drivers at play. Residents' concerns extended beyond dietary behavior to include systematic issues of planning failures, lack of consultation, neighborhood safety and affordability. These findings align with Pillar 1 of the Nutrition Decadal Plan (26), which recognizes that diet-related health outcomes are shaped by complex social and environmental determinants, including urban design and commercial influence. Accordingly, education should be complemented by structural reform that tackles the underlying policy and planning conditions which normalize unhealthy food access.

International evidence offers a roadmap for such reform. In England, for instance, planning authorities have implemented exclusion zones around schools and parks, limited outlet density (including the number of consecutive outlets), have controls to minimize amenity impacts (noise,

litter, signage, traffic), and require health impact assessments for takeaway developments (27). Similar strategies in Australia could strengthen local planning frameworks, empowering councils to balance economic development with public health objectives. Adopting these evidence-based measures would help reduce the proliferation of FFOs, address community concerns and promote healthier, more equitable neighborhoods.

Limitations

This qualitative study captured the depth and complexity of residents' lived experiences, providing insights that can be difficult to obtain via quantitative methods alone. Despite the small sample size ($n=11$), most interviews lasted 30 to 40 minutes, providing rich data that enabled the identification of diverse themes and perspectives. However, given the proximity of participants to the FFO, it is possible that only those residents who were aggrieved by the lack of opposition to the McDonald's development participated in the interviews and those residents who were in support were underrepresented. Nevertheless, the overwhelming number of objections (168 of 183 submissions) and widespread community resistance to similar developments nationally (24, 28, 29) suggest that these perspectives are representative of a broader social concern.

Conclusion

This study is the first internationally to document both the *anticipated* and *realized* experiences of residents living near a multinational FFO. Despite

strong opposition, residents felt ignored by the local Council during the consultation process and are now left to live with the ongoing consequences of a development they did not want. Notably, residents only reported negative impacts post-development, including concerns related to health, safety, pollution and property devaluation and described feeling disempowered and disregarded by the planning system. Only residents living within 300m of the McDonald's restaurant were interviewed and consequently most likely experiencing the negative impacts reported, and therefore generalization to other communities is with caution. Nevertheless, these findings highlight the urgent need for planning reform that embeds health considerations within statutory decision-making, such as the introduction of management zones to limit FFO proliferation near schools and residential areas. Strengthening legislative and policy levers would enable local governments to protect community wellbeing and resist undue corporate influence, ensuring that the design of Australian neighborhoods supports rather than undermines public health.

Declarations

Ethics approval and consent to participate

This study was conducted according to the guidelines laid down in the Declaration of Helsinki and all procedures involving research study consent to participants were approved by the Human Research Ethics Office at The University of Western Australia (2020/ET000264) and Edith Cowan University (2024-05750-TRAPP) s and with adherence to the National Health and Medical Research Council, National Statement on Ethical Conduct in Human Research, 2025.

A total of 3,495 residents living within a 3km radius of the new FFO development were purposively sampled through a postal survey of a larger study which included an invitation to participate in a follow-up interview. A total of 171 adults provided informed consent and completed the survey, and residents living within 300m of the new FFO development that responded positively to the follow-up interview invitation formed the sample for this present study (n=11). These 11 participants were emailed a participant information form, which outlined the process of the qualitative study interview, study approval details and informed consent process. They then completed an online consent form and were subsequently contacted via email or telephone to arrange a convenient time for interview.

Consent for publication

No individual identifying data is reported in this study.
